MindBridge

End-of-Day QA Report

Report Date: 2 November 2026
Environment: Local Development (localhost:3000)
Browser: Chromium via Playwright

1. Overall System Stability

The MindBridge application is currently in a stable state. All core user-facing workflows — including login, navigation, and account profile updates — are functioning as expected. No critical or blocking issues were detected during tonight's regression run.

2. Nightly Regression Summary

The nightly regression suite executed 15 automated tests across four functional areas:

- Login Tests (4 tests) — all passed
- Navigation Tests (5 tests) — all passed
- Account Update Tests (4 tests) — all passed
- Data Reset (1 test) — passed

Result summary:

- Total tests executed: 15
- Passed: 15
- Failed: 0
- Skipped: 0
- Total execution time: 7.8 seconds

Pass rate: 100%

3. Repeated Issues Identified

No repeated failures or intermittent issues were observed in this regression run. All tests passed on the first attempt without retries.

Note: During initial test development, a locator ambiguity was discovered on the Dashboard page (two elements matched the "Account" link). This was resolved by scoping the locator to the navigation bar, and the fix has been verified in tonight's run.

4. Frequency of Recurring Errors

No recurring errors were recorded. The locator ambiguity mentioned above occurred once during development and was corrected before this regression cycle.

5. Potential User Impact

Based on tonight's results, there is no anticipated impact on end users. All user-facing features validated in this run — login, logout, session protection, and account updates — are operating correctly.

If the locator ambiguity had not been resolved, users with assistive technologies could have encountered confusion when navigating to the Account page. This is now mitigated.

6. Recommended Actions

- Continue running the nightly regression suite to track stability over time.
- Expand test coverage to include edge cases such as maximum field lengths and special characters in profile fields.
- Add API-level validation tests to complement the end-to-end browser tests.
- Integrate the Playwright tests into the CI/CD pipeline for automated pull-request checks.
- Monitor database performance as the user base grows to ensure profile updates remain responsive.

7. Final QA Assessment

The MindBridge application meets quality expectations for the features covered in this regression

cycle. All 15 tests passed with a 100% pass rate, and no defects or regressions were detected.

Recommendation: The current build is suitable for continued development. No blockers exist for the upcoming sprint.
